DETAILED ACTION

This office is responsive to argument made by the applicant in the remarks filed on 07/20/2009. The applicant herein cancelled claims 11-16, 18-22, and 24-26.

Allowable Subject Matter

1. Claims 17 and 23 are allowed.

The following is an examiner's statement of reasons for allowance:

Regarding claim 17, the applicant submitted that in Kim, the user equipment goes through a process of synchronization by acquiring system information including code information and RACH access information as disclosed in Kim in [0076]. The user equipment in this process makes cell selection then transmits MBMS request message to the system (RNC) to receive the particular MBMS service. The examiner agrees, in another word and as asserted by the applicant representative, cell selection occurs before any information regarding the MBMS service or the state of the service is sent to the user equipment. Additionally, applicant representative submitted that cell selection in the present application happens after receiving information regarding service of the MBMS and in condition of receiving power ratio of common control physical channel (CCPCH) to the pilot channel (PCH). Cell selection of this application takes place in response to both requirements, one of receiving the MBMS service information and the other being the reception power ratio information of power ratio between (CCPCH) to (PCH). In contrast to Kim's reference, cell selection is done irrespective of any explicitly mentioned condition, rather Kim teaches adjusting power of transmission depending on number of user equipment in available serving cell. In the previous office action, in the

same field of endeavor, Vadgama was provided and relied upon, because cell selection is responsive to a ratio of power of broadcast channel to pilot channel. However, Vadgama effectively does not teach that cell selection is done with respect to both conditions as mentioned above and particularly to MBMS service state information. Furthermore, the power ratio information is broadcast channel power to pilot channel power, but not the CCPCH power to PCH power. One of ordinary skill in the art would have no apparent or obvious way to modify Kim's disclosure to implement cell selection in response to first condition being power ratio and the second being MBMS service state information that comes as a step after the cell selection. Therefore, applicant's disclosure stands distinguished from the applied prior art. Hence, rejection is withdrawn. The examiner have performed thorough search, but nowhere it is found that cell selection is done in response to both condition and specifically to an **MBMS service** state information. The examiner found close related art however, said related art does not anticipate the applicant 371 of PCT date.

Closely related prior art is found to lack explicit or inherent disclosure of the features described above. Namely, Okuyama (US Patent 7,415,277) and Black (US Patent 6,594,501), Cai (USPPA 2004/0229572), and Seo (USPPA 2003/0232622).
